Viewpoint at lane-side gate SE of Woodbury Old Farm at the junctions of lanes

When you come to a lane junction, immediately opposite you there is a field gate with a view ranging from south east through south to west. The ground here is open farmland, with distinct wooded hills on the far left of the view and a long distinct wooded ridge on the right of the view which recedes into the distance in the centre.

A much lower ridge is just visible below the skyline in the centre of the photo, upon which farm buildings are located (Rodge Hill Farm). The long ridge has various names along its length: Cockshot Hill, Rodge Hill and Pudford Hill.

The landforms reflect the resistance of the underlying rocks to weathering and erosion.

The hills and ridges are underlain by (choose):
harder / softer rocks

The lower ground between is underlain by (choose):
harder / softer rocks.

What is the orientation of the continuous wooded ridge on the right? (choose):
north west – south east / east-west /
north east – south west.

What is the orientation of the line of wooded hills on the far left?

The low ridge on which Rodge Hill Farm is located is orientated similarly to the continuous wooded ridge nearby. The continuous wooded ridge is, particularly in its southern part of Pudford Hill, notably steep on both its.

The observations you make here will be of relevance when you come to look at the various cross sections provided at the end of your field exercise.

While you are here, read the information about Location MT12, which is a small quarry just down the lane. The quarry is private and should not be accessed but all the information you need is provided in the app. After that, continue to Location MT13.
